FitTrack: Desktop Gym Workout Tracker

Mid-Term Project Report | Programming in Python | Section B | Spring 2025-26

Student: Din Muhammad Rezwoan **ID:** 23-51712-2

Instructor: MD. Tanzeem Rahat **GitHub:** github.com/Rezwoan/FitTrack

Features

User Authentication

Users can sign up by providing their full name, email address, and a password. Passwords are hashed using bcrypt before being saved, so plain text credentials are never stored on disk. Returning users log in with their email and password, and the app verifies the hash before granting access.

First-Time Profile Setup

After registering, the app directs new users to a profile setup screen before they can access anything else. This form collects height, current weight, gender, target weight, a fitness goal (such as Get Lean, Build Muscle Mass, or Increase Strength), and target muscle groups. Users can also optionally enter their one-rep max for squat, bench press, and deadlift.

Exercise Library

The app ships with a built-in list of common gym exercises, each with a name and target muscle group. Users can also add their own custom exercises using the same fields. The exercise list can be filtered by muscle group to make browsing easier.

Workout Plan Builder

Users can create and name their own workout plans. Each plan holds one or more exercises, and for every exercise the user defines the number of sets, target reps, and weight. Plans are saved locally and can be edited or deleted at any time.

Active Workout Session

From the home screen the user selects one of their saved plans and starts a session. The session screen shows every exercise and its sets, which can be ticked off as they are completed. The reps and weight for each set can be changed on the spot if the actual numbers differ from the plan. Once the user finishes and clicks Finish Workout, the session is saved and a summary is shown on the home screen.

Workout History

All completed sessions are saved and can be browsed in the History screen. Clicking on any past session shows the full details of that day, including every exercise, each set, the reps performed, and the weight used.

Body Weight Log

From the home screen users can log their body weight for the day. If a weight has already been logged for today it is displayed; otherwise an input field is shown to record it.

Profile Page

The profile screen displays a summary of the user's saved details including height, current weight, target weight, gender, fitness goal, target muscles, and one-rep max values where provided.

How to Run the Project

Make sure Python 3 is installed, then follow these steps:

- Clone the repository:
  `git clone https://github.com/Rezwoan/FitTrack.git`
- Move into the project folder:
  `cd FitTrack`
- Install the required libraries:
  `pip install -r requirements.txt`
- Run the app:
  `python main.py`

The three dependencies are customtkinter (GUI framework), bcrypt (password hashing), and Pillow (image handling). All data is stored locally as JSON files so no database setup is needed.
